E-commerce System with Mock Payment Integration: Project Plan

Problem Statement

People need online shopping systems, but building real payment systems is difficult. This project, therefore, creates a safe, fake version to learn and demonstrate how it works.

Since there is a rapid growth of online shopping and it has increased the demand for efficient and user-friendly ecommerce systems. However, many people lack experience in developing real world systems that simulate complete online transaction processes, especially payment integration. Additionally, implementing real payments is complex, costly, and requires strict security and legal compliance.

Therefore, there is a need to develop a functional e-commerce system that stimulates real-world shopping and payment processes in a safe and controlled environment. This project aims to address this gap by creating a web-based e-commerce platform with mock payment integration, allowing users to experience a full online shopping workflow while enabling the developer to gain practical skills in system design, development, and testing.
